

1. (3 points) Tell me about prehensile tails: what are they, which genera have them, why, are they all the same?

2. (3 points) *Aotus* is the only nocturnal anthropoid; what are the hypotheses about why it is nocturnal? (A comparison with *Callicebus* might be appropriate.)

3. (4 points) We have no clear cut Linnaean taxonomy of the larger Neotropical primates; let me define four subfamilies by listing their genera. For each subfamily write a short sentence that would help children learn to distinguish one subfamily from another. (Give the general characteristics, not just a description of one species or genus.)

Cebines (*Saimiri*, *Cebus*)

Aotines (*Aotus*, *Callicebus*)

Pitheciines (*Pithecia*, *Cacajao*, *Chiropotes*)

Atelines (*Alouatta*, *Lagothrix*, *Brachyteles*, *Ateles*)
